Scan Information

Start time: Wed Aug 23 19:36:32 2023 End time: Wed Aug 23 19:58:52 2023

Host Information

Netbios Name:

METASPLOITABLE IP: 192.168.32.120

MAC Address: CA:01:F0:3E:DD:B1

OS: Linux Kernel 2.6 on Ubuntu 8.04 (hardy)

Vulnerabilities

134862 - Apache Tomcat AJP Connector Request Injection (Ghostcat)

Synopsis

There is a vulnerable AJP connector listening on the remote host.

Description

A file read/inclusion vulnerability was found in AJP connector. A remote, unauthenticated attacker could exploit this vulnerability to read web application files from a vulnerable server. In instances where the vulnerable server allows file uploads, an attacker could upload malicious JavaServer Pages (JSP) code within a variety of file types and gain remote code execution (RCE).

Solution	
Update the AJP 9.0.31 or later.	configuration to require authorization and/or upgrade the Tomcat server to 7.0.100, 8.5.51,
Risk Factor	
High

51988 - Bind Shell Backdoor Detection

Synopsis
The remote host may have been compromised.
Description
A shell is listening on the remote port without any authentication being required. An attacker may use it by connecting to the remote port and sending commands directly.
Solution
Verify if the remote host has been compromised, and reinstall the system if necessary.
Risk Factor
Critical
CVSS v3.0 Base Score

20007 - SSL Version 2 and 3 Protocol Detection

Synopsis
The remote service encrypts traffic using a protocol with known weaknesses.
Description
The remote service accepts connections encrypted using SSL 2.0 and/or SSL 3.0. These versions of SSL are affected by several cryptographic flaws, including:
- An insecure padding scheme with CBC ciphers.
- Insecure session renegotiation and resumption schemes.
An attacker can exploit these flaws to conduct man-in-the-middle attacks or to decrypt communications between the affected service and clients.
Although SSL/TLS has a secure means for choosing the highest supported version of the protocol (so that these versions will be used only if the client or server support nothing better), many web browsers implement this in an unsafe way that allows an attacker to downgrade a connection (such as in POODLE). Therefore, it is recommended that these protocols be disabled entirely.
NIST has determined that SSL 3.0 is no longer acceptable for secure communications. As of the date of enforcement found in PCI DSS v3.1, any version of SSL will not meet the PCI SSC's definition of 'strong cryptography'.
Solution
Consult the application's documentation to disable SSL 2.0 and 3.0. Use TLS 1.2 (with approved cipher suites) or higher instead.
Risk Factor
Critical
CVSS v3.0 Base Score
CVSS v3.0 Base Score

192.168.32.120 tcp/5432/postgresql

90509 - Samba Badlock Vulnerability

Synopsis	
An SMB server	running on the remote host is affected by the Badlock vulnerability.
Description	
The version of Samba, a CIFS/SMB server for Linux and Unix, running on the remote host is affected by a flaw, known as Badlock, that exists in the Security Account Manager (SAM) and Local Security Authority (Domain Policy) (LSAD) protocols due to improper authentication level negotiation over Remote Procedure Call (RPC) channels. A man-in-the-middle attacker who is able to able to intercept the traffic between a client and a server hosting a SAM database can exploit this flaw to force a downgrade of the authentication level, which allows the execution of arbitrary Samba network calls in the context of the intercepted user, such as viewing or modifying sensitive security data in the Active Directory (AD) database or disabling critical services.	
Solution	
50IUIION	
Upgrade to Sar	nba version 4.2.11 / 4.3.8 / 4.4.2 or later.

51192 - SSL Certificate Cannot Be Trusted

Synopsis
The SSL certificate for this service cannot be trusted.
Description
The server's X.509 certificate cannot be trusted. This situation can occur in three different ways, in which the chain of trust can be broken, as stated below:
- First, the top of the certificate chain sent by the server might not be descended from a known public certificate authority. This can occur either when the top of the chain is an unrecognized, self-signed certificate, or when intermediate certificates are missing that would connect the top of the certificate chain to a known public certificate authority.
- Second, the certificate chain may contain a certificate that is not valid at the time of the scan. This can occur either when the scan occurs before one of the certificate's 'notBefore' dates, or after one of the certificate's 'notAfter' dates.
- Third, the certificate chain may contain a signature that either didn't match the certificate's information or could not be verified. Bad signatures can be fixed by getting the certificate with the bad signature to be resigned by its issuer. Signatures that could not be verified are the result of the certificate's issuer using a signing algorithm that Nessus either does not support or does not recognize.
If the remote host is a public host in production, any break in the chain makes it more difficult for users to verify the authenticity and identity of the web server. This could make it easier to carry out man-in- the-middle attacks against the remote host.
Solution
Purchase or generate a proper SSL certificate for this service.
Risk Factor

89058 - SSL DROWN Attack Vulnerability (Decrypting RSA with Obsolete and Weakened eNcryption)

Synopsis		
The remote host may be affected by a vulnerability that allows a remote attacker to potentially decrypt captured TLS traffic.		
Description		
The remote host supports SSLv2 and therefore may be affected by a vulnerability that allows a cross- protocol Bleichenbacher padding oracle attack known as DROWN (Decrypting RSA with Obsolete and Weakened eNcryption). This vulnerability exists due to a flaw in the Secure Sockets Layer Version 2 (SSLv2) implementation, and it allows captured TLS traffic to be decrypted. A man-in-the-middle attacker can exploit this to decrypt the TLS connection by utilizing previously captured traffic and weak cryptography along with a series of specially crafted connections to an SSLv2 server that uses the same private key.		
Solution		
Disable SSLv2 and export grade cryptography cipher suites. Ensure that private keys are not used anywhere with server software that supports SSLv2 connections.		
Risk Factor

65821 - SSL RC4 Cipher Suites Supported (Bar Mitzvah)

Synopsis				
The remote service supports the use of the RC4 cipher.				
Description				
The remote host supports the use of RC4 in one or more cipher suites. The RC4 cipher is flawed in its generation of a pseudo-random stream of bytes so that a wide variety of small biases are introduced into the stream, decreasing its randomness.				
If plaintext is repeatedly encrypted (e.g., HTTP cookies), and an attacker is able to obtain many (i.e., tens of millions) ciphertexts, the attacker may be able to derive the plaintext.				
Solution				
Reconfigure the affected application, if possible, to avoid use of RC4 ciphers. Consider using TLS 1.2 with AES-GCM suites subject to browser and web server support.				
Risk Factor				
Medium

57582 - SSL Self-Signed Certificate

Synopsis
The SSL certificate chain for this service ends in an unrecognized self-signed certificate.
Description
The X.509 certificate chain for this service is not signed by a recognized certificate authority. If the remote host is a public host in production, this nullifies the use of SSL as anyone could establish a man-in-the- middle attack against the remote host.
Note that this plugin does not check for certificate chains that end in a certificate that is not self-signed, but is signed by an unrecognized certificate authority.
Solution
Purchase or generate a proper SSL certificate for this service.
Risk Factor

26928 - SSL Weak Cipher Suites Supported

Synopsis	
The remote service supports the use of weak SSL ciphers.	
Description	
The remote host	supports the use of SSL ciphers that offer weak encryption. Note:
This is considera	ably easier to exploit if the attacker is on the same physical network.
Solution	
Reconfigure the affected application, if possible to avoid the use of weak ciphers.	
Risk Factor Medium

104743 - TLS Version 1.0 Protocol Detection

Synopsis	
The remote service encrypts traffic using an older version of TLS.	
Description	
The remote service accepts connections encrypted using TLS 1.0. TLS 1.0 has a number of cryptographic design flaws. Modern implementations of TLS 1.0 mitigate these problems, but newer versions of TLS like 1.2 and 1.3 are designed against these flaws and should be used whenever possible.	
As of March 31, 2020, Endpoints that aren't enabled for TLS 1.2 and higher will no longer function properly with major web browsers and major vendors.	
PCI DSS v3.2 requires that TLS 1.0 be disabled entirely by June 30, 2018, except for POS POI terminals (and the SSL/TLS termination points to which they connect) that can be verified as not being susceptible to any known exploits.	
Calution	
Solution	
Enable support for TLS 1.2 and 1.3, and disable support for TLS 1.0.	
Risk Factor

153953 - SSH Weak Key Exchange Algorithms Enabled

Synopsis
The remote SSH server is configured to allow weak key exchange algorithms.
Description
The remate SSH conver is configured to allow key evolutions algorithms which are considered week
The remote SSH server is configured to allow key exchange algorithms which are considered weak. This is based on the IETF draft document Key Exchange (KEX) Method Updates and Recommendations for Secure Shell (SSH) draft-ietf-curdle-ssh-kex-sha2-20. Section 4 lists guidance on key exchange algorithms that SHOULD NOT and MUST NOT be enabled. This includes:
diffie-hellman-group-exchange-sha1
diffie-hellman-group1-sha1
gss-gex-sha1-*
gss-group1-sha1-*
gss-group14-sha1-*
rsa1024-sha1
Note that this plugin only checks for the options of the SSH server, and it does not check for vulnerable software versions.
Solution
Contact the vendor or consult product documentation to disable the weak algorithms.

78479 - SSLv3 Padding Oracle On Downgraded Legacy Encryption Vulnerability (POODLE)

Synopsis	
It is possible to obtain sensitive information from the remote host with SSL/TLS-enabled services.	
Description	
The remote host is affected by a man-in-the-middle (MitM) information disclosure vulnerability known as POODLE. The vulnerability is due to the way SSL 3.0 handles padding bytes when decrypting messages encrusing block ciphers in cipher block chaining (CBC) mode.	ypted
MitM attackers can decrypt a selected byte of a cipher text in as few as 256 tries if they are able to force a vice application to repeatedly send the same data over newly created SSL 3.0 connections.	im
As long as a client and service both support SSLv3, a connection can be 'rolled back' to SSLv3, even if TLSv1 or newer is supported by the client and service.	
The TLS Fallback SCSV mechanism prevents 'version rollback' attacks without impacting legacy clients; hower can only protect connections when the client and service support the mechanism. Sites that cannot disable simmediately should enable this mechanism.	
This is a vulnerability in the SSLv3 specification, not in any particular SSL implementation. Disabling SSLv3 is to only way to completely mitigate the vulnerability.	ne
Solution	
Disable SSLv3.	
Services that must support SSLv3 should enable the TLS Fallback SCSV mechanism until SSLv3 can be disabled.	
Risk Factor

10407 - X Server Detection

Synopsis
An X11 server is listening on the remote host
Description
The remote host is running an X11 server. X11 is a client-server protocol that can be used to display graphical applications running on a given host on a remote client.
Since the X11 traffic is not ciphered, it is possible for an attacker to eavesdrop on the connection.
Solution
Restrict access to this port. If the X11 client/server facility is not used, disable TCP support in X11 entirely (- nolisten tcp).
Risk Factor
Low
